Dernière mise à jour: 15-04-2008

- memory reserved for each user process connecting to a database
- allocated when a process is created and deallocated when the process is terminated
- used by only one process

main components :

- Private SQL Area (cursor area)
- Session Memory (holds the information related to a session)
- SQL Work Areas (used for memory-intensive operations such as hash-join, bitmap merge, bitmap create, ...)
